(MLRA 6:6)
(Transplantation (Physiology))

Homotransplantations can be readily accomplished in tailed amphibia, but not adult tailless amphibia. However, the heart of an adult frog can be grafted onto another frog. In the case of mammals, only tissues which have a low metabolism (cornea, cartilage, teeth) or organs which carry heavy functional load (kidneys) can be successfully homotransplanted. The immunological reactions to tissues from another individual can be lowered by selecting a younger donor and host, by acting on the nervous system through the medium of artificially induced sleep, or by affecting the immunogenic system with the aid of acetylcholine and cortisone. Expts show that immunological reactions to foreign tissue are not local, but general, i.e., involve participation of the whole organism contg an intact hemopoietic system (spinal cord, spleen, liver).

Title : A Note on the Wire Loop Method for Locating the Median Plane in a
Cyclotron Magnet.

Orig Pub : Glasnik mat.-fiz. i astron., 1955, 10, No 5, 195-198

Abstract : Current-carrying wire loops, attached at one point to the float are
used extensively to investigate the equilibrium orbits in cyclotrons.
The article indicates a method for finding the median plane of a magnet
with the aid of such a loop. It is shown that the central point of the
circle formed by the loop lies in the median plane, if the position of
the float is independent of the current flowing through the loop.

PURPOSE: This is a hand-book for machinists, foremen and workers who set up and tune automatic and semi-automatic lathes of Russian make, to familiarize them with the construction of these machines and their adjustment.

TEXT DATA

Coverage: Basic types of Russian automatic and semi-automatic machine tools, their characteristics, their schematic layouts, their use, their merits and shortcomings are briefly dealt with. Then this book describes in detail the individual typical Russian automatic and semi-automatic machines and the step-step-----

Tokarnyye avtomaty i poluavtomaty (Automatic and Semiautomatic Lathes)
Kiyev, Mashgiz, 1959. 450 p. 30,000 copies printed.

Reviewers: I.I. Kufturskiy, Engineer, and V.V. Korshunov; Eds.:
V.I. Leuta, Engineer, and M.S. Soroka; Chief Ed. (Southern Division,
Mashgiz): V.K. Serdyuk.

PURPOSE: This textbook is intended for students in technical and trade schools.

COVERAGE: This textbook describes constructions of automatic and semiautomatic lathes used in Soviet industry. The technology of machining as it applies to turning operations on different types of lathes is discussed. Questions of maintenance and setup of lathes, safety precautions, and the organization of the work area are examined. The authors thank A.I. Tereshchenko, S.M. Zamanskiy,

TITLE: The effect of the magnetic field of the welding circuit on the shape of internal welds on tubes

PERIODICAL: Avtomaticheskaya svarka, no. 3, 1962, 1-6

TEXT: Results are given of experiments in which it was revealed that the magnetic field forming inside tubes strongly affects the depth and width of welds. The experiments were conducted in order to develop a technology and equipment for welding tubes with straight and spiral joints. Tubes, 529, 720 and 1020 mm in diameter and up to 11.0 mm thick, were moved towards or away from the welding rod. The depth and width of welds were different, depending on the direction in which the tubes were moved and the tube diameter. The data obtained explained difficulties experienced in welding internal welds on tubes on welding stands operating on the principle of moving the tube away from the welding rod. The following conclusions were drawn: (1) The magnetic field of the welding circuit affects the submerged

DO40/D113

The effect of the ...

arc inside the tube and deflects it in an axial direction. This phenomenon is characteristic of single-arc and multi-arc welding, particularly when one of the arcs is supplied with direct current; (2) the use of the welding system whereby the tube is moved towards the welding head, results in better weld shapes and a higher welding speed on longitudinal seams; (3) in welding spiral welds inside tubes, the arc is deflected by the magnetic field along the tube axis just as it is deflected on longitudinal straight welds, but the weld shape varies with the weld spiral angle and is poorest at small angles; (4) welding with a.c. is the simplest means of improving the shape of internal spiral welds; (5) the obtained data are of general significance and indicate practical means for the magnetic control of a powerful submerged arc. There are 5 figures, 1 table and 3 Soviet references.

TITLE: Three-pass welding of helical joint tubes, 1020 mm in diameter, from both
sides

SOURCE: Avtomaticheskaya svarka, no. 10, 1966, 44-47

TOPIC TAGS: ~~welding~~, helical joint tube, tube welding, steel ~~tube~~ welding, ~~submerged~~
arc welding, metal tube

ABSTRACT: Several variants of submerged-arc welding of helical joint 15G2S steel
tubes, 1020 mm in diameter with walls 10—12 mm thick, have been tested. The best
results were obtained with a three-layer weld applied from both sides. First, a
"technological" weld is applied from inside in order to ensure and maintain a correct
alignment of the faying edges. Then a half turn later, the second, outside weld
and another half turn later the third, inside weld are deposited. The weld has a
strength equal to that of the base metal. It had a yield strength of 35.3—50.0 kg/mm²,
a tensile strength of 55.5—63.5 kg/mm², an elongation of 20—29%, a reduction of area
of 58.5—72.5% and a notch toughness of 3.1—8.7 kg/cm² at -40C. This method was
introduced three years ago at the Zhdanov Metallurgical Plant im. Il'ich. Tubes

Card 1/2

UDC: 621.791.756

ACC NR: AP6036017

1020 mm in diameter are now successfully welded at a speed of 1.8 m/min. Despite some operational complexity, the application of this method is justified by its high welding speed, which is twice that of conventional two-sided welding of similar tubes and reduces risks of undercuts, porosity, slag inclusions and other defects. Orig. art. has: 6 figures and 1 table.

TITLE: Anhydro, Desoxy, and Unsaturated Derivatives of Polysaccharides (Anhidro-, dezoksi- i nenasyshchennyye ploivodnyye polisakharidov) I. Desoxy Cellulose From Cyanoethoxyl Cellulose (I. Dezoksitsellyuloza iz tsianoetoksiltellyulozy)

PERIODICAL: Zhurnal obshchey khimii, 1958, Vol 28, Nr 12, pp 3184-3188 (USSR)

ABSTRACT: Deoxidized monoderivatives with methylene groups in the place of secondary alcohol groups (desoses), and with methyl groups in the place of primary alcohols (methyloses) may be found in Nature and can be synthesized in different ways. Until now only few syntheses of deoxidized celluloses of the formula $(C_6H_{10}O_5)_n$ have been published, predominantly with methyl groups obtained by way of tosyl ethers and iodine derivatives. To obtain these celluloses also their iodine derivatives and their unsaturated compounds were reduced (Refs 1,2). The general synthesis of the deoxidized celluloses with methylene and methyl groups were realized by P. P. Shorygin by the cleavage of ether with sodium, especially

Card 1/3

Polysaccharides. I. Desoxy Cellulose From
Cyanoethoxyl Cellulose

SOV/79-28-12-4/41

in liquid ammonia (Refs 3,4). Shorygin and his cooperators used the cleavage reaction of the ethers with Na in liquid ammonia also with methylated sugars, methyl cellulose, benzyl ethers of cellulose and acetyl cellulose (Refs 5-9). Positive results were obtained in the deoxidation of cellulose only in the case of methyl cellulose, however, only a partially de- oxidized methyl cellulose resulted. First the authors processed the industrially produced ethyl cellulose (Ref 10) (46.8% OC_2H_5) with Na in liquid ammonia, yet no sufficient separation of the ethoxyl groups occurred. Based on theoretical considera- tions an easier separation of the cyanoethoxyl groups could be expected when using cyanoethoxyl cellulose. Cellulose actually completely loses these groups, partly as acrylic acid, with methylene and partly methyl groups forming in the place of alcohol groups in the glucose members. Desoxy cellulose is formed as the final product. Part of the cyanoethoxyl groups separates under the formation of desoxy groups, another part as acrylonitrile, due to the reversible cyanoethylation reac-

tion in the alkaline medium. The presence of desoxy groups in the reaction product is proved by the analysis of the final product, its acetate and nitrate. There are 1 table and 13 references, 8 of which are Soviet.

(USSR)

ABSTRACT:

Besides other syntheses of anhydrocellulose (Ref 1) only one paper exists (Ref 2) in which its synthesis is described in the form of its mixed tosyl and acetic ester from the mixed acetic and tosyl ester of cellulose on the action of caustic soda in methyl alcohol. The composition of anhydrocellulose corresponds to the formula $(C_6H_{10-2x}O_5)_n$. For its synthesis the tosyl esters of the cellulose $[C_6H_{10-x}O_5-x(OSO_2C_6H_4CH_3)_x]_n$ were treated with sodium in liquid ammonia or with organic bases (piperidine etc.) (Ref 3). The use of piperidine yielded final products which were difficult to characterize (Ref 4). Samples of anhydrocellulose are described in the experimental

SOV/79-28-12-5/41

part, which were obtained on the action of sodium in liquid ammonia on tosyl cellulose, the composition of which could be proved by its analysis and that of its acetic esters. As the tosyl groups in the cellulose enter mainly the primary, partly also the secondary, and only to a small extent the tertiary alcohol group, the authors could determine the position of the anhydride nucleus in the above anhydrocellulose samples with high probability. On the action of sodium on liquid ammonia the p-toluenesulfonic acid separates under the formation of the anhydro nuclei from the tosyl esters of cellulose which contain more than 1 tosyl group per 1 glucose member; the other tosyl groups are subjected to hydrolysis. There are 2 figures and 5 references, 1 of which is Soviet.

TITLE: Isomerization of Hydroxyaldehydes. XV. Acid Transformations of Glyceraldehyde and Its Halo-Derivatives

PERIODICAL: Zhurnal obshchey khimii, 1960, Vol 30, Nr 3,
pp 717-723 (USSR)

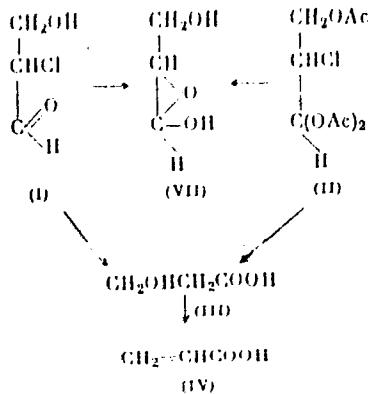

ABSTRACT: Ortho-saccharinic acid was obtained by S. N. Danilov and A. M. Gakhokidze (this Journal, 1936, Vol 6, 706 Ber., 1936, Vol 69, p 2130) in reaction of 2-halo-substituted monoses with lead hydroxide. It was expected, therefore, that monoses containing unsubstituted hydroxyls at C₁ and C₂, with other hydroxyls replaced by substituents stable in an alkaline medium, will isomerize similarly in reaction with Pb(OH)₂ into α -saccharinic acid. It was shown that ($d + 1$) glyceraldehyde (V) isomerized in reaction with freshly precipitated Pb(OH)₂ into lactic acid (VI) whereas

Card 1/6

Isomerization of Hydroxyaldehydes. XV

7B268
SOV/79-30-3-2/63

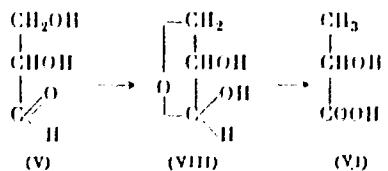

Its halo derivatives, β -chloro- β -hydroxypropanal (I) and 1,1,3-triacetyl- β -chloropropanal (II) gave hydroacrylic acid (III), which was transformed further into acrylic acid (IV).

(Equation cont'd on Card 3/6)

Card 2/6

Isomerization of Hydroxyaldehydes. XI

73248
SOV/79-30-3-2/69

The oxidation-reduction of I and II proceeds here with the participation of Cl atom in α -position with respect to the aldehyde group, and the reaction can be explained by the formation of α -glucosides (VII). The oxidation-reduction of the glyceraldehyde V takes place between the aldehyde radical and the β -alcohol radical; the transformation of V into lactic acid can be interpreted as proceeding through the β -glucoside (VIII).

Considering the above, the formation of saccharinic acids from monoses can be explained by the α - and β -glucoside compounds. β -Alcohol radicals participate chiefly in the oxidation-reduction transformations of

Card 3/6

Isomerization of Hydroxyaldehydes. VI

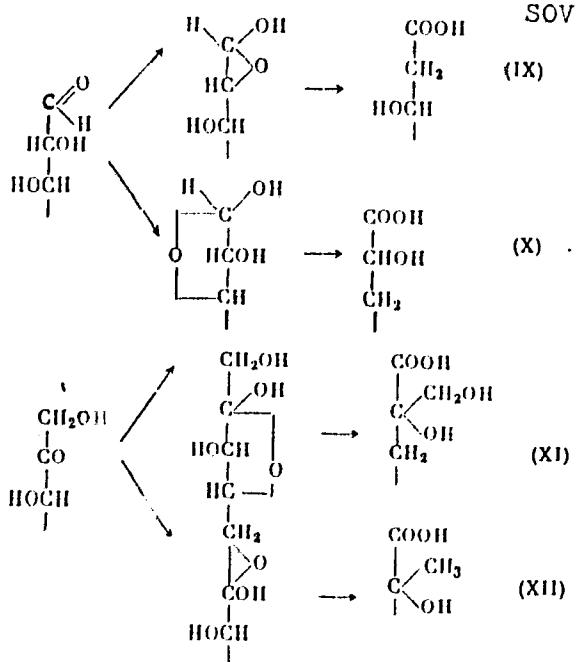

78248
SOV/79-30-3-2/69

aldoses, whereas the formation of o-saccharinic acids (IX) from 2-halo monones can be best represented as going through α -glucosides. The following mechanisms of saccharinic acid formation are advanced: (a) isomerization of aldoses into m-saccharinic acid goes through β -glucoside compounds (X); (b) the formation of isosaccharinic acid possibly takes place with the participation of β -glucoside ketoses (XI) with migration of the H atom into β -position; (c) the formation of saccharinic acids from ketoses goes through the α -glucoside (XII); (d) the formation of p-saccharinic acid (if its suggested structure will be confirmed) from β -ketohexose can be represented as going through <2,3> glucosides with migration of $\text{CH}_2\text{OH}-\text{CH}^{\cdot}<$ radical to the fourth carbon atom.

TITLE: A method for producing polyvinyl chloride foam. Class 39, No. 173403

SOURCE: Byulleten' izobreteny i tovarnykh znakov, no. 15, 1965, 80

TOPIC TAGS: polyvinyl chloride, foam plastic

ABSTRACT: This Author's Certificate introduces a method for producing polyvinyl chloride foam by mixing polyvinyl chloride resin with a plasticizer and additives and then saturating the resultant mass with inert gas under pressure and heating it in a high-frequency current field. The processing is made independent of the moisture-content of the resin by vacuum evaporation treatment of the plastic mass before saturation with the inert gas.

TITLE: Investigation of Adsorption Layers of Xanthogenate on Gold by Means of Radioactive Isotopes

PERIODICAL: Izvestiya vyschikh uchebnykh zavedeniy. Tsvetnaya metallurgiya, 1960, Nr 1, pp 35-42 (USSR)

ABSTRACT: Isoamyl xanthogenates tagged with 35 S and desorbent reagents were used to determine their reaction with a pure gold powder, mesh -0.4, +0.2 mm. The fixation of xanthogenate on gold is assumed to be the result of reaction:

Card 1/4

However, this reaction applies only to thin layers in presence of free areas of metallic gold. The nature of subsequent layers depends on the diffusion of gold ions

Investigation of Adsorption Layers of
Xanthogenate on Gold by Means of
Radioactive Isotopes

77716
SOV/149-60-1-5/27

through the xanthogenate film. The rate of diffusion decreases with the thickening of the film. While only a very thin layer consists of gold xanthogenate, subsequent layers become poorer in gold ions and finally xanthogenate alone is deposited due to weak dispersion forces of molecular interaction. Film formation is influenced by the following factors: Maximum adsorption is observed in a neutral medium with pH = 7. The same was observed by M. D. Ivanovskiy in connection with xanthogenate adsorption on platinum. A simultaneous reaction of gold with xanthogenate and cyanide causes the formation of a xanthogenate film despite the dissolving action of cyanide both on gold and gold xanthogenate. The influence of sodium sulfide is entirely different. Being the strongest depressing agent, it prevents the formation of a xanthogenate film, which may be due to active S^{2-} ions with the gold surface and the formation of AuS and AuS_2 sulfides on it. These facts are confirmed by the desorption of xanthogenate films by NaCN and Na_2S . While the action of the former is

Card 2/4

Investigation of Adsorption Layers of
Xanthogenate on Gold by Means of
Radioactive Isotopes

77716
SOV/149-66-1-5/27

that of a solvent, the latter acts on the film by displacing the collecting agent from it and replacing it with gold sulfides. However, this desorption is incomplete and ends at a level of about 2.5-3 monolayers of the film. These tests conducted with S³⁵ and Au¹⁹⁸ showed that under the action of alkali no gold went into solution while desorption was limited to the upper layers of the film. However, Na₂S picked up a constant quantity of gold $1.5 \cdot 10^{-8}$ g-ions, which were probably present in the film in the form of gold ions. An intensive dissolving of gold by desorption with cyanide proves a mosaic-shaped structure of the xanthogenate film and the presence of free metal areas which are rapidly attacked by NaCN. With increasing xanthogenate concentrations, the film grows not only in thickness but also in width, covering the open areas and delaying the dissolving action of NaCN. For better understanding of the nature of the film, pyridine was used as desorbent. No chemical reaction being involved,

Card 3/4

Investigation of Adsorption Layers of
Xanthogenate on Gold by Means of
Radioactive Isotopes

77710
307/149-56-1-5/37

the desorption is complete. The authors conclude that in the regular concentrations (less than 0.1 g/liter) for flotation, xanthogenate forms films which closely approach the stoichiometric ionic ratio of X^- and the metal. This layer is most stable on the metal surface. A further growth of layers in thickness is not necessary for flotation as the upper layers are less stable and do not enhance water-repellent properties. TITLE: Transistorized nanosecond pulse generator

SOURCE: AN SSSR. Sibirskoye otdeleniye. Izv. Seriya tekhnicheskikh nauk, no. 3, 1963, 109-112

TOPIC TAGS: pulse generator, transistorized pulse generator, test instrument, tunnel diode, nanosecond pulse generator, pulse shaper, short pulse generator

ABSTRACT: Generators of various types of electrical pulses are indispensable for tuning and testing of nuclear electronic equipment. In this article a brief description and calculations are given for a nanosecond pulse generator based on tunnel diodes and a transistor. The generator consists of a master stage, shaping circuit and amplifier. The master stage is a multivibrator based on tunnel diode TD₁ (fig. 1), the pulse shaper is a driven multivibrator based on tunnel diode TD₂. The pulse repetition frequency of the master stage is determined by the inductance of timing coil L₁ or L₂. Oscillations are generated according to

Card 1/5

ACCESSION NR: AF4009190.

the cycle KBFD (fig. 2). Formulas with application of approximation of tunnel diode characteristics by a piece-wise exponential function were used for calculation of the repetition frequency and duration of the pulses (B. N. Kononov, A. S. Sidorov, Tunnel'nye diody i ikh primeneniye v triggerakh. V sb. "Poluprovodnikovye pribory i ikh primeneniye" pod red. A. A. Fedotova, vyp. 7, Izd-vo "Sov. radio", 1962). The duration of the pulse is equal to the time of change in current in the inductance from I_1 to I_2 on the section $B\Gamma$ of the volt-ampere characteristics.

$$t_a = 3L \frac{I_1 - I_2}{U_s - U_b} \left[0.5 - \frac{U_s - E}{U_s - U_b} + \left(\frac{U_s - E}{U_s - U_b} \right)^2 \ln \left| 1 + \frac{U_s - U_2}{U_s - E} \right| \right]. \quad (5)$$

The duration of the pause is determined by the time of change of the current in the inductance from I_2 to I_1 on the section $A\delta$.

$$t_b = 2L \frac{I_2 - I_1}{U_1 - U_s} \left[- \left(\frac{U_1 - U_s}{U_1} \right)^{1/2} + \frac{E - U_s}{U_1} \ln \left| 1 + \frac{U_1 - U_s}{E - U_s} \left(\frac{U_1 - U_s}{U_1} \right)^{1/2} \right| \right]. \quad (7)$$

Card 2/5

ACCESSION NR: AP4009190

The generator has an output pulse duration of 10 nsec at a repetition frequency in two bands from 100 kcs to 2000 kcs and 2 mcs to 10 mcs. Calculated parameters differed from experimentally obtained values by less than 10%. Orig. art. has: 2 figures, 8 formulas and 1 table.

TITLE: Measurement of the displacement of the worked piece during explosive forming

18

SOURCE: Samoletostroyeniye i tekhnika vozduzhnogo flota, no. 2, 1965, 90-97

TOPIC TAGS: explosive forming, chronometer, time measurement, metalworking

ABSTRACT: The author makes a detailed analysis of the discrete method of measuring the displacement of a worked piece. The method is based on the measurement of time intervals corresponding to the arrival of the worked piece to a prescribed point. The pulse-counting chronometer described by P. I. Pavlenko (Schetno-iupul'snyy khronometr. Fizmatgiz, M., 1963) is used for the measurement of short intervals of time. The analysis shows that the method employed is the most convenient and accurate one. In order to improve the accuracy in the measurement of very short intervals of time (10^{-4} – 10^{-5} sec) it is necessary to employ pulse-counting chronometers with an oscillation frequency of the generator of the standard frequency of the order of 10^6 – 10^7 cps. The greatest accuracy in the determination of the instant the worked piece arrives at the prescribed point is provided by electric contact sensors. In cases where leakage from the electric contacts is possible, it is necessary to use highly sensitive contactless switches. Orig. art. has: 6 figures and 3 tables.

TITLE: Radiotechnical method for measuring the motion parameters of the blank during sheet metal stamping

SOURCE: Samoletostroyeniye i tekhnika vozduzhnogo flota, no. 3, 1965, 84-85

TOPIC TAGS: metal stamping, test instrumentation, UHF instrument

ABSTRACT: A mostly qualitative description of a radiotechnical method for measuring the displacement of the die during sheet metal stamping is briefly presented. The method consists of attaching a metal "flag" to the die and using this flag to partially block the path between two ultrahigh frequency waveguides, one of which serves as a transmitter and the other as detector. After calibrating the change in transmitted UHF energy as a function of flag position in the gap between the guides, this curve can be used to interpret the die motion (position or velocity) as recorded on an oscilloscope during a stamping operation. Any centimeter range UHF generator can be used. A sample calibration curve and a sample stamping curve are presented without details or specifications as to operating ranges, accuracy, etc. Orig. art. has 3 figures.

TITLE: Investigation of an electrohydraulic source and some of its potential applications

SOURCE: Samoletostroyeniye i tekhnika vozdushnogo flota, no. 4, 1966, 107-109

TOPIC TAGS: electrohydraulic effect, shock wave, electric discharge

ABSTRACT: The authors describe a highly efficient coaxial electrohydraulic source for industrial use. A diagram of the device is shown in figure 1. The annular aluminum electrode 2 is fastened to textolite base 1 by bolts. Stainless steel electrode 3 is fastened to the base inside the aluminum electrode and located on its central axis. Voltage is fed to the annular and central electrodes from a battery of condensers through a controllable discharger. The electrical discharge between the electrodes develops in the form of individual spark channels. A schematic diagram of the experimental unit used for testing the source is shown in figure 2.

Voltage from regulator 1 is fed through step-up transformer 2 and high-voltage rectifier 3 to condenser battery 5 with a total capacitance of 6 μ f. The charging voltage is monitored on electrostatic kilovoltmeter 6. The current in the discharge circuit is registered by a low-inductance Rogowski loop with an integrating circuit connected in the coaxial cable. The signal from this integrating circuit is fed to one channel of an oscilloscope. A capacitance signal from the voltage divider is fed to the second channel of the oscilloscope through a 75 Ω impedance matching resistor. Analysis of the oscillosograms shows that the cyclic frequency of the discharge is 925 Kc while the inductance of the discharge circuit is 0.2 μ h. The current amplitude of the discharge reaches 16 KA when 10 Kv is applied to the condenser plates. Water velocity is a linear function of discharge voltage with the approximate equation $W=4V+1$, where W is water velocity in m/sec and V is voltage in Kv. At a distance of 3 m
